

Prompt Life v0.27.14 Human Test Packet

Prompt Life is ready for **small human testing**, not badge issuance.

Known status:

- Badge: under construction
 - Human review: pending
 - Credential issue status: not yet issued
 - Active Journey cards: 39
 - Active checkpoint questions: 136
 - Checkpoint choices: 544
-

Short Tester Instructions

Use the app on a phone-sized screen if possible. Move through a few Journey cards, answer checkpoint questions naturally, and notice where the app helps you reason about the model instead of memorizing app wording.

Please do not try to get a perfect run. Wrong choices are part of the test because they should teach without shaming.

What To Test

- Whether each checkpoint question is understandable without rereading the whole card. - Whether the question makes you reason about an LLM mechanism, boundary, or human-use decision. - Whether one answer feels clearly best. - Whether wrong answers feel plausible rather than silly. - Whether feedback explains the misconception you selected. - Whether the feedback avoids revealing the correct answer too directly. - Whether mobile layout, scrolling, and bottom navigation stay comfortable.

Feedback To Collect

For each confusing checkpoint, capture:

- Learning card title.
- Question text.
- The answer you chose.
- Why that answer seemed tempting.
- Whether the feedback helped.
- Any wording that felt too technical, too vague, too long, or unfair.

Report Confusing Questions

Mark a question as confusing if:

- The stem depends on a phrase you do not yet know.
- More than one answer seems equally defensible.
- The question asks for app wording instead of model reasoning.
- The scenario is too abstract to picture.

Report Unfair Distractors

Mark a distractor as unfair if:

- It is obviously silly.
- It uses a term before the app has taught it.
- It is partly true in a way the feedback does not explain.
- It is much shorter or much vaguer than the correct answer.

Report Jargon

Flag any use of terms such as logits, tensors, hidden states, grounding, RAG, inference, alignment, or autoregression when the question does not give enough context to understand them.

Report UI Friction

Tell us if:

- The checkpoint panel is hidden by the bottom nav.
- The Next question or Next learning card button is hard to reach.
- Answer text is too dense on a small screen.
- Feedback appears too low, too late, or too long.

Wrong-Answer Feedback Standard

Wrong choices should feel instructive, not humiliating. A good wrong-answer response should:

- Name the selected misconception.
- Explain the boundary in plain language.
- Stay calm.
- Avoid language like failed, wrong, score, or streak.
- Avoid giving away the correct answer too directly.

Current Human-Review Focus

- Feedback rewritten for naturalness: 334 items. - Boilerplate feedback occurrences removed: 334. - Answer-length warnings resolved: 41. - Answer-length warnings intentionally retained for human review: 15.

Final Reminder

Prompt Life is being tested as a learning app and evidence model. The badge remains under construction until human review confirms the Journey, checkpoint bank, and evidence standard are credible.
