

PROMPT LIFE INTERNAL REPORT · V0.20 · JUNE 6, 2026

Workday Stage Audit

This audit covers Journey stage 3: Attention, MLP, Layers, and Hidden States. It is documentation-only and did not alter the live curriculum.

Summary

- Stage order is correct: Attention -> MLP -> Layers -> Hidden States.
- The cards need richer lesson architecture fields, especially durable/temporary and prompt/current-context notes.
- MLP and Hidden States are the highest-priority visual and interaction repair targets.
- No Image 2 asset is recommended for the next Workday pass; labels and relationships matter too much.
- Layers is the best lightweight CSS 3D candidate.

Verification

- `npm run typecheck` : passed.
- `npm run build` : passed with the existing Vite large-chunk warning.
- `npm run build:pages` : passed with the existing Vite large-chunk warning.
- `npm run audit:answers` : passed.
- 51 screenshots were captured in Preview mode; progress remained unchanged in the temporary profile.

Attention visual aid

VISUAL AID

What to picture

MLP Reshape
The MLP reshapes each token position feature vector.

Key terms

MLP

Input context

Hidden state

Attention

CORE IDEA

An MLP is a feed-forward network that reshapes each token position's feature vector.

WHERE IT HAPPENS

It appears inside transformer

VISUAL AID

What to picture

Layer Stack
Repeated blocks refine hidden states while carrying useful signal forward.

Key terms

Tap a term to open the glossary.

Layer

Attention

MLP

Hidden state

CORE IDEA

A transformer layer is a repeated block that usually combines attention, MLP feature reshaping, residual paths, and normalization.

Layers visual aid

MLP visual aid at 320px

CORE IDEA

A hidden state is the model's temporary internal context-shaped vector for a token at a given layer.

WHERE IT HAPPENS

Hidden states appear during the forward pass after embeddings enter the layer stack.

WHY IT MATTERS

They are where the prompt's context changes the token representation before the model scores possible next tokens.

HOW IT CONNECTS

One relationship

Hidden states are created while processing the current context during a forward pass; they are not the visible response.

METAPHOR

Useful picture

A scratchpad of numbers that changes while the prompt is being processed.

 Home  **Journey**  Play  Glossary  Badge

Hidden States core idea

Hidden states exist for this run. They are not permanent memory.

CHECKPOINT

Why is it called hidden state?

A It is a secret memory file

B It is internal numbers, not visible text

C It is encrypted English

Insight unlocked. Hidden means inside the model's working representation.

REFLECT

Teach it back in one sentence.

Reflection is available in Learn mode.

Hidden States checkpoint feedback

Next Implementation Prompt

Implement a v0.20.1 Workday visual/interaction repair pass. Do not add new Journey cards, games, generated PNGs, heavy 3D libraries, progress-rule changes, checkpoint-randomization changes, or extra badges. Keep the Workday order: Attention, MLP, Layers, Hidden States. Convert these four cards from the older slim schema to the richer lesson architecture by adding explicit core explanation, model lifecycle, durable-vs-temporary, prompt-vs-response/current-context notes, misconceptions, and clearer feedback. Update coded visuals so Attention uses a concrete token relationship, MLP shows per-token feature reshaping after attention, Layers shows repeated attention-plus-MLP blocks, and Hidden States contrasts embedding with temporary context-shaped hidden state. Add or revise tiny interactions using connect-nodes for Attention, toggle-state for MLP, lightweight stack inspect for Layers, and sort-buckets or toggle-state for Hidden States. Run `npm run typecheck`, `npm run build`, `npm run build:pages`, and `npm run audit:answers`.
