

Prompt Life Main Branch Update

Generated by Codex on May 31, 2026. Scope: publish the current mobile-first Prompt Life changes to the GitHub main branch for smartphone testing.

Repository	KevinHegg/promptlife
Branch	main
Commit pushed	bd02188 - Build Prompt Life mobile learning app
Pages deploy	GitHub Actions run 26728780188 completed successfully.
Test URL	https://kevinhegg.github.io/promptlife/

What I Published

- The current Prompt Life mobile-first app changes on main.
- Prompt-vs-response teaching updates, glossary additions, and reset/debug controls.
- Concept animations, Trace One Prompt, How AI Learns, updated docs, screenshots, and report PDFs.
- The storage/reset report PDF previously requested.

Checks

- npm run typecheck passed locally before commit.
- npm run build passed locally before commit.
- GitHub Pages workflow passed build and deploy.
- The deployed Pages URL returned HTTP 200 and served the built Prompt Life app shell.

How To Test On A Smartphone

Open this URL on your phone:

<https://kevinhegg.github.io/promptlife/>

For debug reset tools, use:

<https://kevinhegg.github.io/promptlife/?debug=1>

Screenshots

Screenshots included for the live mobile page and the relevant prompt/response plus reset/debug UI.

Core idea

A large language model is a learned system that predicts likely next tokens from the context it can see.

Metaphor

A very large autocomplete engine with learned structure, not a mind or a database.

HOW IT CONNECTS

One relationship

During inference, the current context enters a forward pass, one generated response token is chosen, and that token is appended before the next pass.

PROMPT VS RESPONSE

The response grows one token at a time.

The model does not process the prompt once and then write a whole answer.

1. The current context enters the model.
2. The model predicts probabilities for the next token.
3. One token is chosen.
4. That token is appended to the context.
