

# Prompt Life

Mobile-first MVP for teaching how large language models work from pretraining to response. The product tone is warm, precise, and model-literate: reduce mystery without hype or fear.

## What changed

Expanded the seed into a polished Vite + React + TypeScript app with 21 lessons, 24 glossary terms, saved progress, reflections, stronger mini-games, improved glossary drawer behavior, and mobile-first UI polish.

## Verification

Ran `npm install`, `npm run typecheck`, and `npm run build`. All passed. Mobile browser QA at 390 x 844 found no console errors.

## Files Changed

- `src/main.tsx` : app state, lesson flow, interactions, games, glossary drawer, badge screen.
- `src/data/content.ts` : 21-lesson A-to-Z path plus the required glossary coverage.
- `src/styles/global.css` : mobile layout, focus states, reduced motion, cards, controls, games.
- `src/styles/promptlife.tokens.css` : token cleanup for current visual system.
- `README.md` : exact local development and build instructions.
- `docs/PRODUCT_BLUEPRINT.md` : learning architecture and v0.2 direction.

## How To Run

From the project folder, run `npm install`, then `npm run dev`, then open `http://localhost:5173/`. For verification, run `npm run typecheck` and `npm run build`.

## Done

- Navigation: Home, Learn, Play, Glossary, Badge.
- Lesson pattern: definition, relationship, metaphor, tiny interaction, checkpoint, reflection.
- LocalStorage progress for lessons, game insights, reflections, and location.
- Mini-games: Context Stack, Attention Weave, Token Pipeline Relay.
- Badge unlock requires lesson checkpoint progress plus mini-game insights.
- Core teaching distinctions kept explicit: training vs inference, embeddings vs hidden states, attention vs human attention, logits to softmax to sampling, context windows vs memory, diffusion vs autoregressive text.

## Next Three v0.2 Improvements

1. Add short instructor mode with discussion prompts and downloadable classroom handouts.
2. Add a guided "trace one prompt" animation that links tokens, hidden states, logits, and sampled output across one continuous run.
3. Add lightweight accessibility QA with automated checks and keyboard-only walkthrough scripts.

# What Is an LLM?

A learned next-token prediction system

## Definition

A large language model is a learned system that predicts likely next tokens from the context it can see.

Token

Weight

Inference

## Relationship

The model's weights are shaped during training, then used during inference to turn your prompt into a sequence of next-token choices.

SIDE TOURS

## Play to understand

No scores, timers, or leaderboards. Just small simulations that make invisible model mechanics easier to see.

### Context Stack

Fit the right cards into a limited context window.

### Attention Weave

Draw relevance arcs between token nodes.

### Token Pipeline Relay

Explore pass, transform, and hold operators.

## Context Stack

Push cards into a window that holds only the last 4. Older cards fall out of view.

*Window is empty.*

**Fell out:** nothing yet

Goal: keep user request, examples, and tone in view together.

System: helpful tutor

User: explain LLMs

First tokens are

Contextual cues

DEFINITIONS PLUS RELATIONSHIPS

## Glossary

Use each term with its neighbor. That is where the mental model gets stable.

### Search terms

token, tensor, softmax...

### Pretraining

The broad first stage of training that updates model weights by learning next-token patterns from large datasets.

Pretraining creates general capability before fine-tuning or inference.

### Token

A chunk of text the model processes.

Text is split into tokens before token IDs retrieve embeddings.

### Token ID

The number assigned to a token by the tokenizer.

Token IDs are used to look up embedding vectors.

### Embedding

A learned starting vector for a token.

Embeddings are durable learned representations

### PROGRESS

## Model Literate

A confidence badge, not a leaderboard.

0

of 21  
lessons

3

of 3 game  
insights

0

reflections

### Badge criterion

Complete at least 80% of lesson checkpoints and save two mini-game insights. Then explain how text becomes tokens, tokens become vectors, vectors become hidden states, and a response emerges one token at a time.
