

Prompt Life v0.3 Animation Report

A concise handoff report with mobile screenshots for the concept animation pass, Trace One Prompt, and How AI Learns.

Status

- Done locally; nothing was pushed to GitHub.
- The app now includes lightweight React/SVG/CSS concept animations.
- Trace One Prompt and How AI Learns are available from Play and Journey.
- Progress remains localStorage-based; no backend or leaderboard was added.

What changed

- Added reusable animation primitives in **src/components/ConceptAnimations.tsx**.
- Wired animations into existing lesson interactions without rebuilding the app from scratch.
- Added **Trace One Prompt**, following “Explain attention simply.” from text to tokenization, embeddings, tensors, attention, MLPs, hidden states, logits, softmax, sampling, and autoregressive repeat.
- Added **How AI Learns**, covering supervised learning, self-supervised learning, pretraining, instruction tuning, human feedback learning/RLHF, preference optimization, in-context learning, RAG, online learning, and self-play.
- Updated animation, accessibility, review, product blueprint, and README documentation.

Verification

- **npm install**: passed.
- **npm run typecheck**: passed.
- **npm run build**: passed.
- Manual 390px browser QA completed for lesson animation, Trace One Prompt, and How AI Learns.

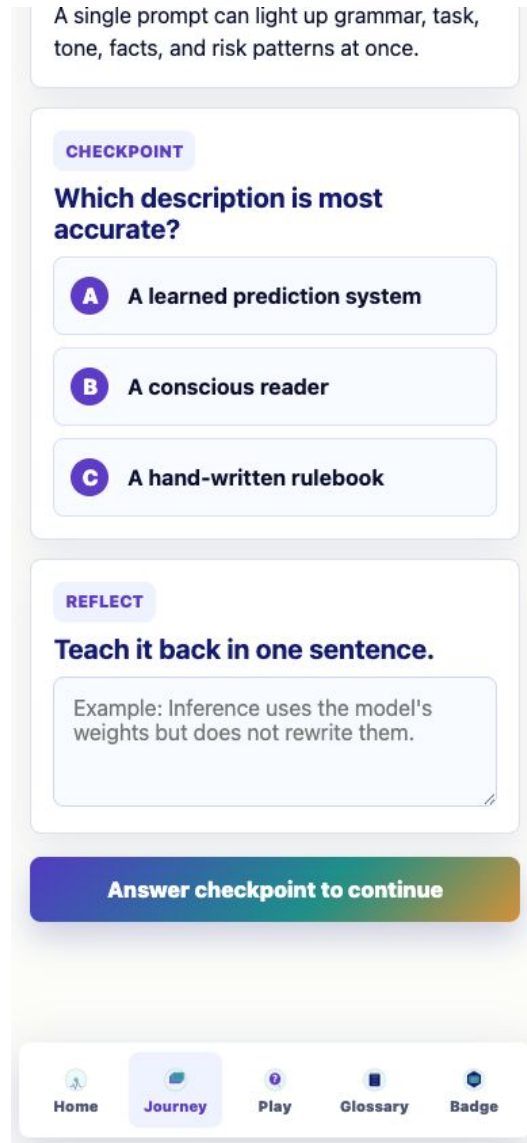

Next best improvements

- Add automated axe/Playwright accessibility checks.
- Add instructor/classroom mode.
- Add a glossary relationship graph tying animations to terms.

Screenshots

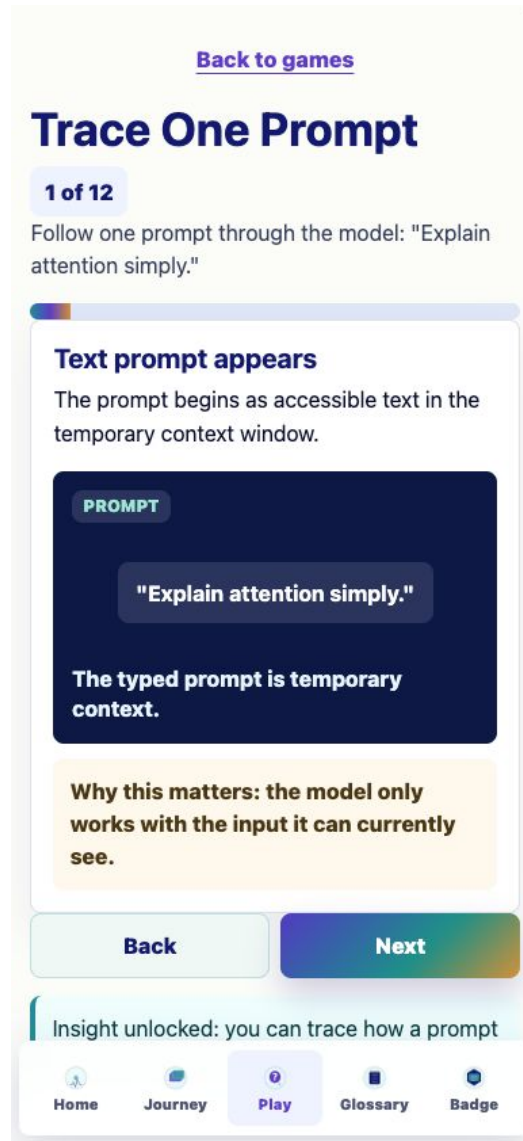

The following pages embed the v0.3 mobile screenshots captured at 390px width.
