

Attention Match v1

This pass replaces the old Attention Weave compatibility interaction with a purpose-built five-round Play challenge about token relevance, context clues, and the limits of the attention metaphor.

Summary

What Changed

- Attention Match now opens a new shared-shell challenge instead of the old Weave board.
- The challenge has five tiny rounds with target tokens, source candidates, SVG arcs, and immediate feedback.
- Progress writes through `promptlife.playChallenges.v1` with attempts, completions, last outcome, review-suggested state, and misconception tags.
- App/package version moved to `0.27.1`.

Learner Promise

Learners practice attention as weighted relevance between token positions. The screen keeps the metaphor explicit: relevance is not awareness, intention, or mind-reading.

Challenge Flow

Round	Target	Best source	Teaching point
The cat hid under the bed because it was scared.	it	cat	A pronoun can depend on an earlier noun.
Maya put the trophy on the shelf because it was heavy.	it	trophy	The clue word can make the source clear.
The professor praised the student after she solved the problem.	she	student	The later action can point to the right earlier person.
Before the lecture, the slides were updated, and they helped the class.	they	slides	Plural clues matter.
The answer sounded confident, but this did not make it true.	this	sounded confident	A phrase or idea can be the source.

Copy Added

Challenge subtitle: "Connect a target token to the earlier context it depends on."

Success feedback: "Good connection."

Review feedback: "This choice reveals a common mix-up."

Completion: "Completed. You matched target tokens to context clues."

Review completion: "Completed. Review suggested. Closeness and relevance were mixed at least twice."

Storage Behavior

- Created/read/written: `promptlife.playChallenges.v1`.
- Preserved/read independently by Glossary Dojo: `promptlife.glossaryDojo.v1`.
- Preserved/read bridge keys: `promptlife:v1:gameInsights`, `pl.gameInsights`, `promptlife:v1:traceComplete`, `pl.traceComplete`, `promptlife:v1:promptRunProgress`, `pl.promptRunProgress`, `promptlife:v1:learningTourComplete`, and `pl.learningTourComplete`.
- Updated legacy bridge behavior so old Attention Weave insight only fills empty shared progress, instead of overwriting newer Attention Match review status.

QA Result

Automated Mobile QA

- Happy path completed with status `completed`, 1 attempt, 1 completion, and 100% best progress.
- Review path completed with status `review-suggested`, 2 attempts, 2 completions, and 100% best progress.
- Play landing showed Attention Match as `Review suggested` after the review path.
- Badge page showed `1 of 5 play challenges` after Attention Match progress.
- Reset progress cleared shared Play storage and Glossary Dojo storage.

Smoke Routes

Opened without horizontal overflow at 390px: Glossary Dojo, Context Stack, Probability Picker, Prompt Run, and Attention Match.

At 320px, the active Attention Match start state measured `scrollWidth 320` and `clientWidth 320`.

Verification Commands

- `npm run typecheck`: passed.
- `npm run build`: passed with the existing Vite large-chunk warning.
- `npm run build:pages`: passed with the existing Vite large-chunk warning.
- `npm run audit:answers`: passed. Total surfaces: 69; randomized surfaces: 46; excluded fixed-order surfaces: 23.

Known Issues

Attention Match v1 uses fixed examples and simplified arcs/weights. That is intentional: the goal is a clean mental model, not a literal attention-head visualization.

Next Pass Recommendations

1. Attention Match v2: add a second set of examples after more phone testing.
2. Prompt Run v2: streamline the capstone into a more continuous shared-shell experience.
3. Probability Picker v2: add a clearer logits-to-softmax transformation view.
