

Midnight Ledger Implementation Report

This PDF wraps the implementation summary and the requested mobile screenshots for the three Midnight Ledger cards.

What Changed

- Repaired Collective Intelligence into a source-trace and rights-question visual plus a human-question sort.
- Repaired Costs We Must Count into a cost ledger visual plus a tap-to-reveal ledger interaction.
- Expanded Risk vs Myth into full lesson architecture, a mechanism-vs-myth visual, a six-item sort, and a four-choice randomized checkpoint.
- Added glossary support for risk literacy, tool use, overreliance, vendor lock-in, concentration of power, bias, and information pollution.
- Bumped the visible app version to `v0.24.1`.

Preserved

- No Journey cards, Journey order, games, generated PNG assets, dependencies, progress rules, checkpoint randomization, badge logic, or Glossary Dojo logic changed.
- Prompt Injection / Tool Risk remains inside Risk vs Myth and the glossary; no standalone card was added.

Verification

- `npm run typecheck`: passed
- `npm run build`: passed with existing Vite large-chunk warning
- `npm run build:pages`: passed with existing Vite large-chunk warning
- `npm run audit:answers`: passed; Risk vs Myth is now a four-choice randomized checkpoint

320px/390px overflow: No horizontal overflow detected in captured states.

Preview mode: Previewing this card. Progress will not change.; Previewing this card. Progress will not change.; Previewing this card. Progress will not change.

Home assets: Generated Home mark and hero loaded.

Glossary Dojo: Play screen still exposes Glossary Dojo.

Midnight Ledger

Count the costs, shadows, and debts honestly.

The instant answer is weighed against data, labor, infrastructure, privacy, and power.

FOCUS

What costs and debts must be counted.

KEEP CLEAR

The answer feels weightless; the infrastructure is not.

Collective Intelligence, Extracted

Borrowed Flames

No creators, no model

Human-created traces can become training data and model patterns, while rights and responsibility remain human questions.

- Human expression** Books, sites, code, art, journalism, forums, documentation, and research leave learnable traces.
- Collection questions** Provenance, consent, copyright, attribution, and compensation matter.
- Model limit** The model absorbs statistical patterns; it does not understand gratitude or responsibility.

Key takeaway:

The model did not create its abilities alone.

Midnight Ledger overview, 390px

Collective visual, 390px

TINY INTERACTION

Which questions stay human?

provenance

Human question

consent

Human question

copyright

Human question

compensation

Human question

model weights

Model mechanics

prompt tokens

Model mechanics

Human question

provenance, consent, copyright,
compensation

Model mechanics

model weights, prompt tokens

Insight strengthened. Human-created traces can shape models, but rights, attribution, consent, and compensation remain human and institutional questions.

What to picture

Cost Ledger

The answer is not weightless

AI systems depend on infrastructure, human systems, and governance choices that need honest accounting.

- 1 Infrastructure** Energy, water, carbon, data centers, chips, and e-waste vary by system and workload.
- 2 Human systems** Labor disruption, deskilling, privacy, bias, and information pollution depend on deployment choices.
- 3 Power** Concentration of data, compute, and capital affects who benefits and who decides.

Key takeaway:

Costs vary, but they are real enough to count.

Labor

Privacy

Governance

Governance: Institutions decide procurement, review, accountability, and acceptable use.

Tap a ledger entry to see what responsible AI literacy has to count.

CHECKPOINT

Which statement is most responsible?

A

One prompt always has the same footprint

B

All AI costs are identical

CHECKPOINT

Which is a real institutional risk?

- A** The model secretly training itself during every ordinary chat.
- B** Softmax stealing files.
- C** Uploading private data.
- D** The model becoming conscious in the chat.

Insight unlocked. Privacy exposure is a practical risk caused by data, context, tools, and institutions.

REFLECT

Teach it back in one sentence.

Reflection is available in Learn mode.

Known Issues

- The existing Vite large-chunk warning remains.

- Future Image 2 generation is ready for the Costs card if a later pass wants a textless supporting asset; this pass intentionally added no generated PNGs.
